Trans. of Uspekhi Sovremennoy Biologii (USSR) 1942, v. 15, no. 3, p. 283-294.

The hypothesis is advanced that acetylcholine is liberated not at the nerve endings but by excitation of a widely distributed receptive substance in muscle fiber which is a carrier of acetylcholine and of cholinesterase. As excitation spreads, each portion of the receptive substance in succession liberates acetylcholine, which then initiates a local contraction. In non-tonic muscle the receptive substance serves only to transmit excitation from nerve to muscle.
